

What is Condensation Drying?

Provides the most energy efficient and sanitary way to dry dishes in a dishwasher.

How does Condensation Drying work?

It draws away moisture from hot dishes to the cooler wall of the stainless steel tub, resulting in dry dishes.

1. The final wash rinse is set to a very high temperature

2. Hot water is drawn from the dishes to the Stainless Steel dishwasher wall

3. Water droplets condensate on Stainless Steel and run down to drain

4. Resulting in Dry Dishes!

Sanitation and NSF Certification: Condensation Drying reaches the NSF standard of 99.9% reduction in bacteria

Pros of Condensation Drying vs. Exposed Heating Element:

1. No Melting! Does not melt plastics. You can load plastics on the lower rack

2. No hot spots! Certain areas of the dishwasher will not dry better than others

3. Save Energy! Still more energy efficient than using a heating element

How to identify an exposed heating element in a dishwasher: Looks like a large black ring at the bottom of the dishwasher tub

Tips for Improved Drying:

-Use rinse aid -Select "auto" cycle + "extra dry" or "sanitize" options (increases final water temperature) -Do not open the door until full cycle is completed Dishwashers Best Accomplice: Rinse Aid -Improves drying -Helps water "roll off" surfaces

-Reduces water spotting
